1 Introduction

Often times, a project becomes big enough that it is infeasible for it to be worked on by a single Agile Team. Examples of such can be entire product suites or multi-departmental projects. Under these circumstances, it becomes more useful to divide the project amongst multiple agile teams. By the nature of the agile workflow, this can become chaotic and counter-productive unless managed properly. To ensure efficient and functional multi-team agile development process, teams should prioritize communication, clear objective definitions, cross-functional teams, and a decentralized but cohesive architecture.
